VACCINES MADE SIMPLE

Did you know that most childhood vaccines produce immunity about 90-100% of the time?¹

It's true.

VACCINES SAVE LIVES

Since coming into widespread use, immunizations have **saved billions** of lives worldwide.²

During 2000-2010, measles vaccination prevented an estimated **20.3 million deaths.**³

For most vaccine-preventable diseases, there has been a **95%** or more reduction in incidence.⁴

VACCINES PROTECT THE VULNERABLE

When more people are vaccinated, there's less chance of an outbreak. This is called **herd immunity.**

Some people, like those being treated for cancer, may not be able to get certain vaccines and are **at risk** from those who are unvaccinated.

4 of 5 babies caught whooping cough from someone in the home.⁵

50,000 Adults die from vaccine-preventable diseases in the U.S. every year.⁶

VACCINES ARE SAFE

The FDA requires up to **10 or more years** of testing for all vaccines before they are licensed.⁷

Many studies have shown **there is no link** between vaccines and autism.⁸

The **side effects** of vaccines, if any, are **almost always minor.** Serious side effect/allergic reactions are very rare.⁹

BY GETTING VACCINATED, YOU PROTECT:

- Your family, particularly the very young and old
- Those who are sick or can't be vaccinated
- Your entire community
- Future generations

Speak with a **pediatrician** you trust about your questions and concerns, and to determine the best vaccine schedule for your child.
